

## **The Keys to Successful Risk Identification**

**Sim Segal, FSA, CERA, MAAA**  
President  
SimErgy Consulting LLC

**ERM Symposium**  
**Session 2B: The Keys to Successful Risk Identification**  
**April 13, 2010**

# Risk identification components

- Risk categorization and definition
- Qualitative risk assessment
- Emerging risk identification

# Common practice is not best practice

- Risk identification most common ERM stage completed, since it's the first
- Yet, suboptimal practices are pervasive, resulting in:
  - Incorrect prioritization from qualitative risk assessment
    - Focusing on some minor risks
    - Missing some key risks altogether
  - Inaccuracies in downstream ERM stages
    - Incomplete and misleading risk quantification
    - Poor risk decision-making
    - Improper risk disclosures

# 5 Keys to successful risk identification

1) Define risks by source

2) Categorize risks evenly

3) Identify risks prospectively

4) Gather data appropriately

5) Define metrics clearly

# 1) DEFINE RISKS BY SOURCE

# Risks are commonly defined inconsistently, by both source and outcome

	By Source	By Outcome
New competitor		
Supplier failure		
Technology failure		
Reputation damage		
Ratings downgrade		
New costly regulations		
Terrorist attack		

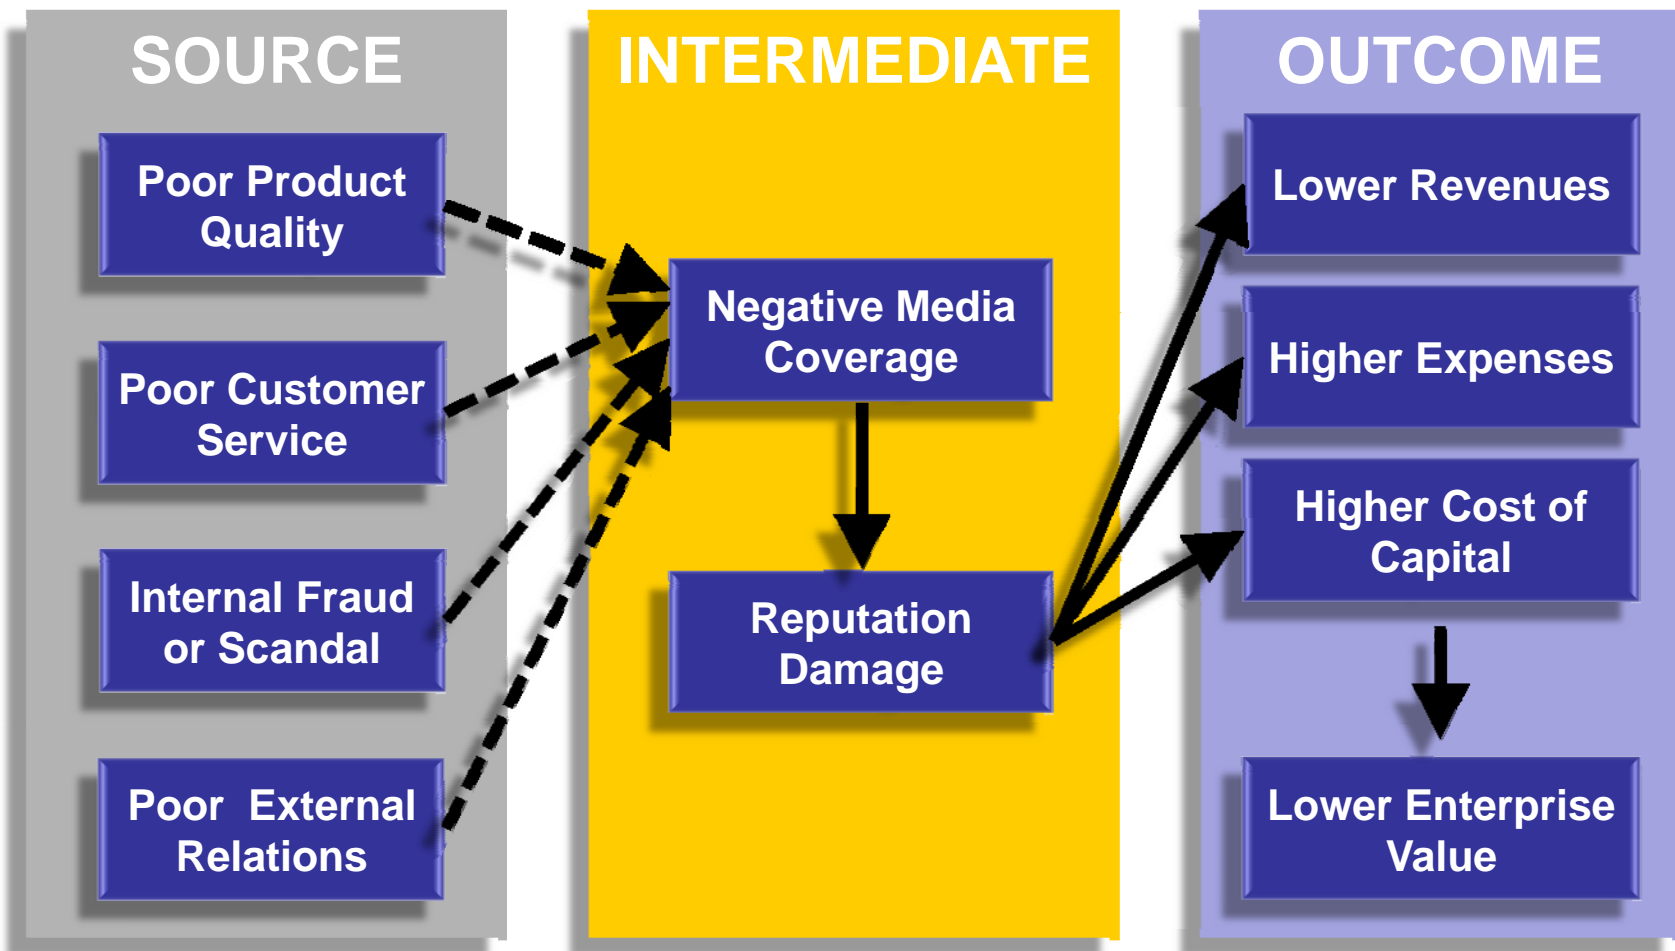

**Which risks are defined by source and which by outcome?**

# Risks are commonly defined inconsistently, by both source and outcome

	By Source	By Outcome
New competitor	X	
Supplier failure	X	
Technology failure	X	
<b>Reputation damage</b>		<b>X</b>
<b>Ratings downgrade</b>		<b>X</b>
New costly regulations	X	
Terrorist attack	X	

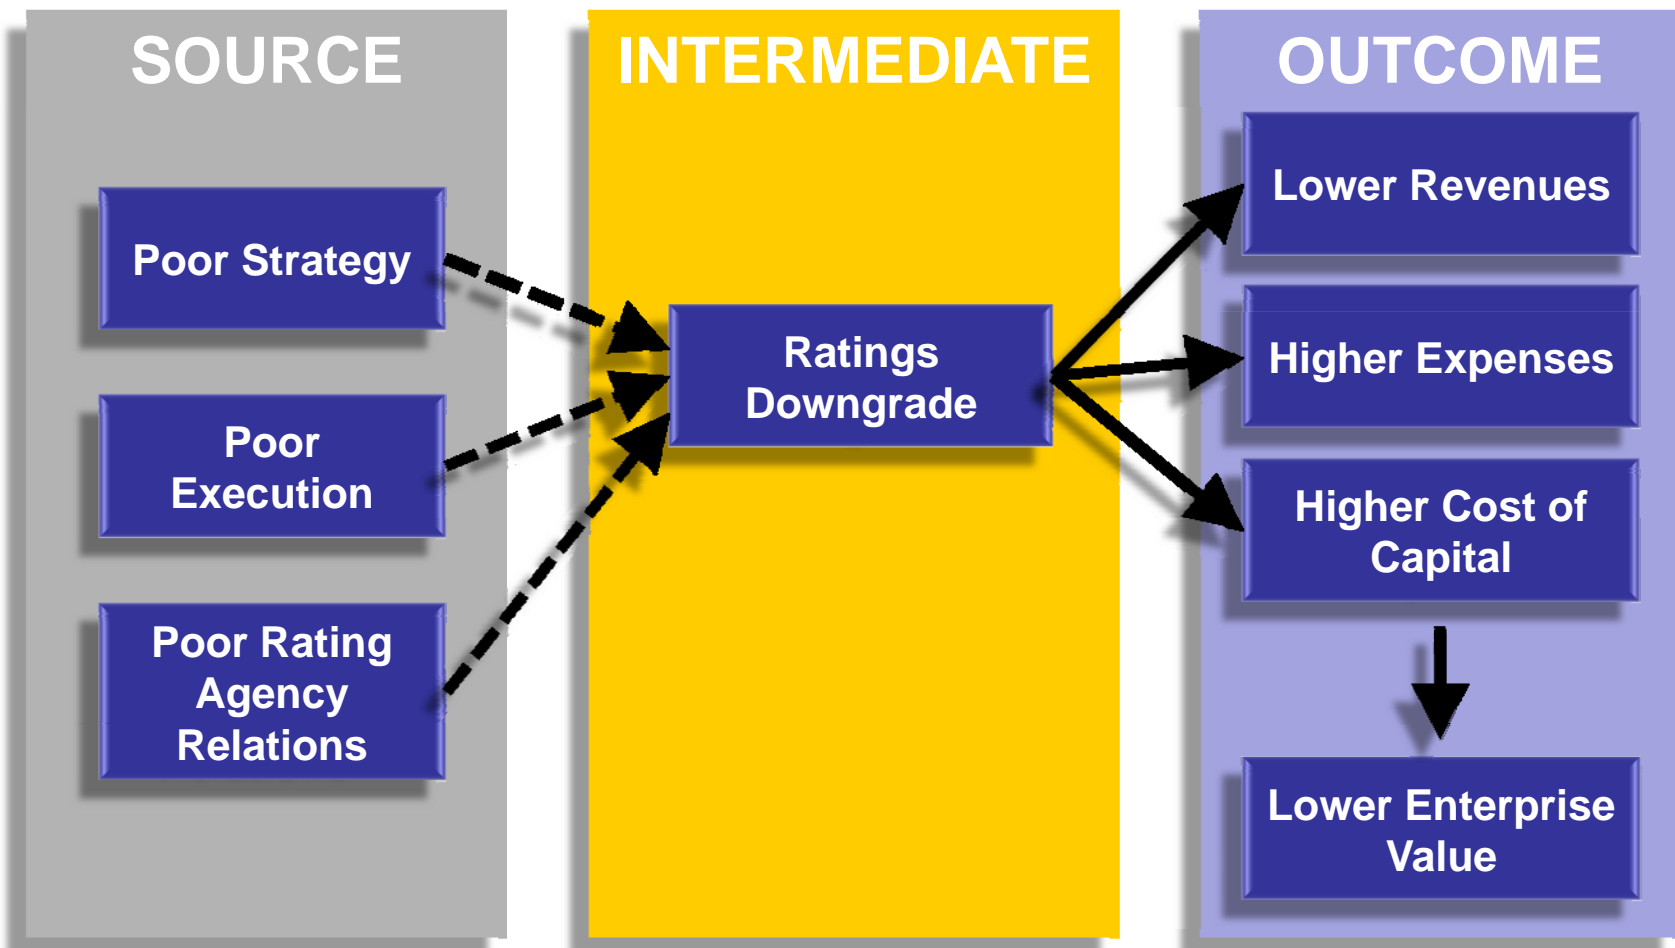

# Many different sources of risk can cause reputation damage

# Ratings downgrades can be triggered by several different risk sources

# Issues caused by inconsistent risk definitions are resolved when defining risks by source

	<b>Common Practice</b>	<b>Best Practice</b>
	<b>Inconsistent Definition</b>	<b>Consistent Def. by Source</b>
<b>Qualitative Risk Assessment</b>	Survey participants not all considering same risk source when scoring	Consistent understanding of each risk source by survey participants
<b>Risk Quantification</b>	Risk scenarios hampered by ambiguous definition	Risk scenarios flow logically from originating source
<b>Risk Decision-making</b>	Mitigation difficult to identify (since mitigation is done at source of risk)	Mitigation readily identified/evaluated: <ul style="list-style-type: none"> <li>▪ For both pre- and post-event</li> <li>▪ Source and downstream impacts apparent</li> </ul>

## 2) CATEGORIZE RISKS EVENLY

# Categorize risks evenly to avoid difficulties

Level of Abstraction	Too High	Too Low	Appropriate
<b>Example</b>	Talent management	Low retention of mid-level staff in business segment X	<ul style="list-style-type: none"> <li>▪ Ability to recruit/retain</li> <li>▪ Succession planning</li> <li>▪ Labor relations</li> <li>▪ Etc.</li> </ul>
<b>Difficulties</b>	Poor qualitative risk assessment, since it obscures individual risks within category	Causes some risks to be missed, since it may omit the overarching category and its other risks	

# 3) IDENTIFY RISKS PROSPECTIVELY

# Identify risks prospectively to avoid the “fighting the last battle” syndrome

<b>Diagnosis</b>	“Fighting the Last Battle” Syndrome
<b>Cause</b>	Over-emphasis in risk identification process of past events
<b>Symptom</b>	Some risks on key risk list merely because of a recent past event burned into management’s memory
<b>Prognosis</b>	<ul style="list-style-type: none"><li>▪ Qualitative risk assessment scoring will be skewed, over-emphasizing risks with recent occurrences</li><li>▪ Some risks that should be on the radar may be crowded out</li></ul>

# 4) GATHER DATA APPROPRIATELY

# The right data, at the right time, in the right way

	Common Practice	Best Practice
<b>What data?</b>	<ul style="list-style-type: none"> <li>▪ Frequency score</li> <li>▪ Severity score</li> <li>▪ Additional data                             <ul style="list-style-type: none"> <li>• Historical experience data</li> <li>• Mitigation in place/planned</li> <li>• Etc.</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>▪ Frequency score</li> <li>▪ Severity score</li> </ul> <p>(only purpose: identify key risks)</p>
<b>When?</b>	Additional data: during risk identification phase (too early), and for all risks	Selected additional data: during risk quantification (when needed), and <u>only for key risks</u>
<b>How ?</b>	<p>Templates</p> <ul style="list-style-type: none"> <li>▪ Often filled in too quickly</li> <li>▪ No live guidance</li> <li>▪ No confidentiality</li> </ul>	<p>Interviews</p> <ul style="list-style-type: none"> <li>▪ Consistent time spent on each</li> <li>▪ Interactive guidance/discussion</li> <li>▪ Confidential, anonymous input</li> </ul>

# 5) DEFINE METRICS CLEARLY

# Typical Frequency-Severity Scoring Guide for Qualitative Risk Assessment

Frequency		Severity	
5	Very high	5	> \$100M
4	High	4	\$50M - \$100M
3	Moderate	3	\$25M - \$50M
2	Low	2	\$10M - \$25M
1	Very low	1	< \$10M

# Clearly defining frequency and severity avoids sub-par results due to inconsistent scoring

	Common Practice	Best Practice
<b>Frequency</b>	<ul style="list-style-type: none"> <li>▪ No guidance on risk scenario               <ul style="list-style-type: none"> <li>• Armageddon?</li> <li>• Most likely scenario?</li> </ul> </li> <li>▪ Participants are all scoring different risk scenarios</li> </ul>	<ul style="list-style-type: none"> <li>▪ Focus on credible worst case scenario</li> <li>▪ Participants are all scoring a similar risk scenario</li> </ul>
<b>Severity</b>	<p>No clear definition of metric</p> <ul style="list-style-type: none"> <li>• Earnings hit?</li> <li>• One time or cumulative?</li> <li>• Hit to market capitalization?</li> <li>• Other?</li> </ul>	<p>Single, consistent metric that captures all impacts: <math>\Delta</math>value</p> <ul style="list-style-type: none"> <li>• Provide brief tutorial to give feel of enterprise value metric</li> </ul>
